Electrophysiology Lab to Utilize ControlOR™ Software

Omaha, NE (December, 2010) Alegent Health Bergan Mercy will implement Banyan Medical Systems' ControlOR software in an electrophysiology lab in early January, 2011. Banyan Medical Systems has also implemented the ControlOR software into general operating rooms, cardiovascular operating, hybrid OR rooms, and interventional radiology suites across the Midwest.

In an electrophysiology lab, various procedures and treatments occur for patients with abnormal heart rhythm. These procedures range from implanting devices to various types of ablations - all which require several sources of information, such as X-ray/fluoroscopy, ultrasound, hemodynamics, PACS, cameras, mapping systems, recording systems, in order for the physician to have a comprehensive view and understanding of the patient's condition.

ControlOR, a software based integration solution, can integrate disparate sources of information, such as those in the EP lab, into a single interface providing an electrophysiologist and medical staff in the lab seamless access and interaction with these data sources in order to make the best possible decisions for a patient's care.

In addition to ControlOR, the BMS solution will also feature a Banyan eight (8) megapixel ultra-high resolution monitor of diagnostic quality. This monitor features four times the resolution of a full high definition panel and can display high definition (HD) digital content for extreme visual clarity and the most precise image analysis available for the physicians during a case.

Alegent Health Bergan Mercy also utilizes ControlOR in its state-of-the-art cardiovascular operating rooms and several general operating rooms. By further implementing ControlOR in the EP lab, Bergan Mercy will have the ability to "tie" their EP lab to the CVORs. This will allow physicians conducting cases in any of the operating suites to collaborate with physicians in other operating suites, simply and quickly through the use of ControlOR. The ability to collaborate in this way will result in better care and outcomes for the patient and maximize the room utilization of the ORs and EP Lab.
